

ABSTRACT OF THE DISCLOSURE

An industrial parts washer includes a stand adapted to support a part, a chamber selectively moveable from a first position clear of the part to a second position engaging the stand where the chamber forms a closed volume encapsulating the part. A nozzle is positioned within the chamber to supply pressurized fluid for cleaning the part. The industrial parts washer may include a washing station positioned adjacent a drying station where each of the washing and drying stations include chambers selectively moveable to enclose the part.
